Aspirin-C

Acetylsalicylic acid, the drug substance of Aspirin-C must not be taken during the last trimester of pregnancy due to an increased risk of complications for mother and baby before and during the birth.

This medicine belongs to a group of drugs (non-striadal antiphlogistics) which could impair women's fertility. Therefore the risk is particularly great when several different antilagistics are taken concomitantly.

At low doses acetylsalicylic acid causes a reduction of platelet aggregation. This may cause a gout attack in predisposed patients.

Adolescent

Aspirin-C should not be taken by adolescents with feverish illnesses; if they have one of the following illnesses do so by a doctor and other therapeutic measures have failed:

Prolonged vomiting in conjunction with such illnesses could be a sign of Reye's syndrome, a very rare but life-threatening disease which requires immediate medical attention.

Interactions with other drugs

Information for your doctor or pharmacist (if you are taking/using other medicines or have taken/used other medicines recently, even if they are non-prescription medicines. Using other medicines or have taken/used other medicines recently, even if they are non-prescription medicines.

Please inform your doctor or pharmacist if you are taking.

Before taking any medicines consult your doctor or pharmacist.
